Factory Make Up Air, Ventilation & Spot Cooling

Integrated Air Systems Ltd have supplied HVAC systems to the beverage can making sector for nearly 20 years. This enables us to use our past experience to design, supply and install systems that work in line with the operational process.

Make up air systems are interlocked to the process to ensure the process area always maintains a positive pressure. Ventilation systems based on acceptable air changes to reduce the heat rise in the process area can be designed, supplied and installed. Spot cooling of operator areas can also be provided to reduce the need for high air change rates from the ventilation system.

These systems come with supply air filter houses, fans, distribution systems, inline burners for make up air in cold environments, dx cooling coils, dx condensers, support steels and PLC control panel.

Advantages of Using Our Factory Make Up Air, Ventilation & Spot Cooling Systems:

- **Maintain a Positive Air Pressure**
in the production area at all times
- **Ensure a Pleasant Working Environment**
for operators is maintained at all times
- **Reduce Large Air Changes**
by incorporating spot cooling around areas that operators predominantly work.
- **Remove Odours**
and excess high level heat from the production area.
- **Turnkey or Supply Only Solutions**

Common Applications: Production area, offices and welfare areas.

Common Sectors: Two piece D&I canmaking, can ends making.

If you have any questions or wish to discuss your particular business' needs then please get in touch via the details below or visit our website. We are always happy to answer any queries that you may have.
